

Nandhini Deluxe — AI Roadmap

13 of 24 ideas below are already live in this demo, computed from real data the same way every other module works — the rest is exactly what we can build next, each scoped to the screen and data it extends.

Purchase & Finance

Invoice Scan → GRN → 3-Way Match LIVE IN THIS DEMO Photograph a vendor invoice at GRN entry; it auto-fills the receipt and the existing 3-way match engine catches the rest. HOW A vision model reads the invoice into structured line items; each field carries a confidence score, so low-confidence lines are flagged for a human glance rather than trusted silently. VALUE Cuts GRN entry from ~10 minutes to under one, and catches short-deliveries or rate drift the moment the invoice is scanned.	Duplicate & Price-Creep Watch LIVE IN THIS DEMO Catches a vendor invoice submitted twice, or a rate that has crept up across bills without a renegotiated PO. HOW Exact-match duplicate detection on vendor + invoice number, plus a rate-drift check per vendor+item across recent bills. VALUE Two ways to overpay a vendor, caught automatically instead of by a sharp-eyed reviewer.
Cash-Flow Gap Signal LIVE IN THIS DEMO Flags when near-term vendor bills outweigh near-term customer collections. HOW Nets the existing AP and AR aging-bucket calculations against each other — no new forecasting model, just the two ledgers read together. VALUE A payables crunch seen a week early instead of discovered at payment time.	Plain-English Match Notes READY TO BUILD NEXT Turns a bare "MISMATCH — ₹340 variance" into a written explanation of what likely happened and what to check. HOW An LLM narrates the existing 3-way match output — no new matching logic, just readable copy on top of it. VALUE A finance exec can act on the mismatch without opening the line-by-line panel first.

Front of House

Discount & Void Watch LIVE IN THIS DEMO Flags a cashier or outlet whose complimentary bills and discounts run well above their peers. HOW Statistical comparison of each cashier's concession rate against their outlet's own average, over a trailing 14-day window. VALUE Surfaces a billing-integrity issue before it becomes a quarter-end surprise.	Billing-Time Upsell Prompts LIVE IN THIS DEMO Identifies a popular item that rarely gets paired with another popular item, as a concrete bundle suggestion. HOW Market-basket co-occurrence analysis over recent orders — the same technique behind "customers who bought this also bought." VALUE A specific, testable combo idea to lift average ticket, not a generic upsell tip.
Order-Chit Recognition READY TO BUILD NEXT A captain's handwritten table chit, photographed at the counter, becomes a punched POS order. HOW Vision-LLM reads handwriting against the live Menu Master and resolves item names by fuzzy match. VALUE No re-typing item names under pressure during a rush.	Aggregator Review Triage ON THE ROADMAP Swiggy/Zomato reviews auto-sorted into food, delivery, or service complaints and routed to the right outlet manager. HOW Sentiment and topic classification (NLP) over review text — needs a review dataset the app doesn't ingest today, only settlement amounts. VALUE The angriest complaints reach a manager first, not buried in a star-rating average.

Kitchen & Inventory

Demand-Aware Reordering

LIVE IN THIS DEMO

Catches an item that's still above its static reorder level but trending toward a stockout — the case a fixed threshold misses.

HOW Recent consumption trend converted into "days of cover" against current stock, layered on top of the existing reorder-level rule.

VALUE A purchase order goes out before the shelf actually empties, not after.

Expiry & Waste Radar

LIVE IN THIS DEMO

Flags a batch drifting toward expiry early enough to push it into a special, a staff meal, or a transfer.

HOW Forward-looking scan of batch expiry dates already captured at GRN — distinct from the existing wastage report, which only looks backward at what's already been thrown out.

VALUE Fewer write-offs, caught while the stock is still usable.

Camera Stock Count

ON THE ROADMAP

Walk the store room, photograph each shelf; the count reconciles against what the ledger expects.

HOW Computer-vision object counting per SKU — genuinely harder than invoice OCR, since a cluttered shelf is a much noisier scene than a printed line item.

VALUE A physical audit in minutes rather than a clipboard afternoon — worth prototyping, but flagged honestly as lower-fidelity than the other vision use cases.

Sales & Guest Accounts

Collections Assistant

READY TO BUILD NEXT

Drafts the payment-reminder message for every overdue account, tone-matched to how overdue it is.

HOW LLM drafting keyed off the existing AR aging bucket and customer risk ranking.

VALUE Ready-to-send reminders instead of a finance exec writing each one from scratch.

Quote & Proposal Drafting

READY TO BUILD NEXT

Guest count, occasion, and budget in — a formatted catering proposal out.

HOW LLM generation grounded in the Menu Master and historical pricing for similar orders.

VALUE A same-call proposal instead of a follow-up email days later.

Hotel Front Desk

Dynamic Rate Advisor

LIVE IN THIS DEMO

Suggests a rate bump when the next few days are trending toward a sellout, or a promo when occupancy is running low.

HOW Near-term booked-room-nights compared against total room-nights available per outlet.

VALUE A revenue-manager habit, applied automatically at outlets too small to have one.

Guest Memory Upsell

LIVE IN THIS DEMO

A returning guest checked in today gets flagged with what they actually ordered last stay.

HOW Matches the current guest's phone number against past reservations, then reads their last stay's folio for a concrete room-service history.

VALUE A proactive "the usual?" instead of a generic greeting.

No-Show Risk Flag

LIVE IN THIS DEMO

Flags a reservation still marked BOOKED on or after its own check-in date.

HOW A direct read of reservation status against the business date — the actual moment a no-show becomes real, not a speculative prediction.

VALUE A room released or a guest called before the night is lost to an empty booking.

Banquet & Events

Hall Demand Heatmap

LIVE IN THIS DEMO

Flags a hall with zero confirmed bookings in the next two weeks.

HOW A direct scan of upcoming CONFIRMED bookings per hall against the calendar.

VALUE Time to run a promotion before the date is a guaranteed empty hall, not after.

Instant Banquet Quote

READY TO BUILD NEXT

Hall, date, guest count, and budget in — a package quote with menu suggestions out.

HOW LLM generation grounded in hall capacity, past booking rates, and the Menu Master.

VALUE A same-conversation quote instead of a callback the next day.

Workforce (HRMS)

Attendance Pattern Watch

LIVE IN THIS DEMO

Flags an employee whose late arrivals or unplanned absences have piled up over the last month.

HOW Trailing 30-day count of LATE/ABSENT attendance statuses per employee against a threshold.

VALUE A manager conversation happens while it's still a pattern, not after it becomes a habit.

Resume Screening & Ranking

READY TO BUILD NEXT

A stack of applications for an open role becomes a ranked shortlist with the reasoning shown.

HOW Resume parsing plus skill/requirement matching against the role — needs a resume-upload field the ATS doesn't capture today.

VALUE Hours of first-pass screening compressed into a ranked list.

Smart Roster Builder

ON THE ROADMAP

Builds next month's shift roster balancing labor cost, expected footfall, and weekly-off preferences.

HOW A real constraint-based schedule optimizer — genuine optimization engineering, not a quick add, replacing today's deterministic seed generator.

VALUE The single biggest time sink in outlet management, automated — but scoped honestly as the heaviest build on this list.

Executive Intelligence

Peer-Outlet Benchmarking

LIVE IN THIS DEMO

Flags the one outlet trailing its peers on trailing revenue by a meaningful margin.

HOW Reuses the existing outlet-comparison report, adding a peer-median deviation check on top.

VALUE The comparison a regional manager doesn't have time to run by hand every week.

Ask-Your-Data Assistant

READY TO BUILD NEXT

The existing chat widget upgraded from keyword matching to real questions answered in real language.

HOW LLM function-calling over the Reports & Analytics service and live store data, with drill-down links back into the app.

VALUE "Which outlet's margin dropped last week, and why?" — answered, not just routed to a report.

Auto-Narrated Daily Digest

READY TO BUILD NEXT

Every outlet manager gets three sentences on yesterday: sales vs. target, one thing to fix, one thing going well.

HOW LLM narrative generation over the existing dashboard KPI computation; the text is a straightforward build, sending it out by WhatsApp/email is a further step needing a messaging integration.

VALUE A daily brief that's actually read, instead of a dashboard that has to be opened.

Every "live" item is a deterministic, rule-based computation over this demo's own data — not a hosted AI model — the same honesty convention the rest of the platform already uses.
